Education

University of California, Irvine — Irvine, CA

B.S. Applied and Computational Mathematics, Minor in Computer Science ***GPA 3.9/4.0*** — *Sep 2023 – Jun 2028*

- Took two-year leave of absence to build Opennote (YC S25), then joined Reducto via acquisition.

Experience

Reducto — San Francisco, CA

Software Engineer — *Apr 2026 – Present*

- Designed and launched a durable workflow execution platform, along with its SDKs, connectors, and a managed agent runtime, for product design partners.
- Embedded with enterprise customers as a forward-deployed engineer, scoping integrations, agent automation, and custom workflows that cut end-to-end process latency 80%, supporting six-figure deals.
- Led migration to a unified authentication service across all products, and an agent-first redesign of developer onboarding, cutting new user drop-off from 46% to 17% in one quarter.
- Built a zero-trust internal app-hosting platform on Cloudflare: non-engineers shipped ∼200 agent-built tools in two months with 100% team adoption, and over 30% were shared directly with customers and prospects.
- Drove production reliability and operations: incident response and postmortems, cost of goods sold (COGS) tracking, safer rollouts, a SaaS-to-GCP migration for on-prem clients, and compliance work (audit prep, data retention and deletion) to close regulated customers.

Opennote (YC S25, acquired by Reducto) — San Francisco, CA

Co-Founder & CTO — *Nov 2024 – Apr 2026*

- Co-founded an AI-native learning platform and scaled it from 0 to 75,000+ users (20,000+ MAU, 2,500+ DAU) as product owner and sole backend engineer, owning all infrastructure from day zero through acquisition.
- Architected the core platform: realtime agent-user collaboration, authentication and security systems, a text-to-content generation pipeline, and developer APIs and SDKs used by consumers and customers.
- Ran research on LLMs and retrieval systems for agent-enabled education, informing the core product's content generation and retrieval infrastructure.
- Raised $4M in venture funding, closed partnerships with Meta, Groq, and Desmos, edited technical media content, gave talks at MIT, UC Berkeley, and UC Irvine, and led SOC 2 compliance audit process.

Browserbase — San Francisco, CA

Software Engineering Intern — *Mar 2025 – May 2025*

- One of the first 3 engineers on Director, Browserbase's first consumer product: a browser agent that lets non-technical users automate the web in natural language. Shipped it from zero to beta.
- Built the cloud browser infrastructure behind Director, including parallel session management for concurrent agent runs and the code-generation pipeline, iterating on reliability from live user feedback.

NASA Johnson Space Center — Houston, TX

Pathways Software Engineering Intern — *Aug 2024 – Nov 2024*

- Prototyped fuel-efficient autonomous spacecraft control algorithms in C/C++ for VxWorks; built data verification workflows (Python, SQLite) and GitLab CI integrating Northrop Grumman and MAXAR components.
- Built operator tools for Gateway Space Station downlinked data in React and TypeScript, with high approval from flight operations leadership and human factors engineers.

Software Engineering Researcher — *Dec 2023 – Jun 2024*

- Led a 10-engineer NASA SUITS team building a spacewalk guidance system (Python API, TypeScript/React control app); secured $8,000+ in grants for mission simulations at NASA's lunar testing facilities.

Skills & Awards

AI/ML Systems: Agent runtimes, workflows, sandboxing, observability, MCP, LLM evals, retrieval systems
Languages: TypeScript, Python, Go, C/C++, SQL, Bash, Java
Infrastructure: AWS, GCP, Cloudflare, Postgres, Redis, Modal, Terraform, Docker, Kubernetes, Firecracker, Datadog
Awards: Y Combinator S25, UCI Excellence in Undergraduate Research Award, California Space Research Grant
